## **OpenQM for the Intel Mac**

Ladybridge Systems today announces availability of the OpenQM multivalued database product for the Intel version of the Apple Mac.

OpenQM has been available on the PowerPC Mac since March 2007. Today's announcement brings the product forward onto the latest Mac systems.

Providing what is probably the lowest total cost of ownership of any multivalued database product together with advanced functionality and outstanding support services, OpenQM is now available for Windows, Linux, FreeBSD, PowerPC and Intel Mac, and Windows PDAs.

OpenQM takes the industry standard multivalued data model and extends it to include object oriented programming alongside many new features in dictionaries, the command language, the query processor and application programming.

A licence for OpenQM includes the powerful AccuTerm terminal emulator and Coyote persistent web server at no additional cost.

For more information about OpenQM visit [www.openqm.com](http://www.openqm.com).
